Pendulum Thermal Noise

$$X^{2}(\boldsymbol{w}) \approx 4k_{B}T \frac{g}{\boldsymbol{w}^{5}} \left[\frac{1}{L_{w}^{2}} \sqrt{\frac{Eg}{4\boldsymbol{p}nm}} + \boldsymbol{q}_{g}^{2} \frac{E}{mL_{w}} \right] \frac{\boldsymbol{f}_{wire}}{T_{b}C_{s}}$$

Wire loss angle: $\mathbf{f}_{wire} = \mathbf{f}_0 + \mathbf{f}_{th} + \mathbf{f}_e$

- T_b : Breaking strength C_s : Confidence factor
- f_0 : Material loss angle f_{th} : Thermoelastic loss angle f_e : Excess loss angle

Thermoelastic los
angle
$$f_{th} = \Delta \frac{wt}{1 + (wt)^2}$$
$$\Delta = \frac{Ea^2T}{c}$$
$$t = \frac{d_w^2}{p^2D}$$

- Excess loss angle – Frictional processes in the marionetta-wire clamps
 - Frictional losses in the wiremirror contact point

Present solution

The Virgo present solution for the suspension last stage uses four 200 μ m diameter C85 steel wires.

In these conditions:

-
$$f_0 \sim 10^{-4}$$

- $f_{th} (max) \sim 10^{-3} (at 680 \text{ Hz})$

$$-C_{\rm S} = 0.6$$

- T_b~ 2.9 GPa

H.Vocca - GWADV Isola d'Elba, Italy, May 19-26 2002

The next step will be the monolithic solution

H.Vocca - GWADV Isola d'Elba, Italy, May 19-26 2002

FS Production facility

- Pure O₂-H₂ flame
- No fiber-support contact
- Direct measurement of the fiber diameter
- Directly tested the fiber breaking strength using a new automatic device

H.Vocca - GWADV Isola d'Elba, Italy, May 19-26 2002

FS Breaking strength (1)

The breaking strength of FS fibers depends on material purity, <u>production</u> and handling procedure.

 $T_b^{SiO_2} = 4.05 \pm 0.55$ GPa $T_b^{C85} = 2.90 \pm 0.02$ GPa

 ϕ_w/T_b is a factor 200 lower for FS fibers, but C_s is lowered by the large T_b fluctuation.

H.Vocca et al., Proc. of the3th Lisa symposium (2000, sub. to Class. Quant. Grav)
 M.Punturo et al, talk to the GREX meeting (Grasse, 2000)
 P.Amico et al, Nuclear Inst. and Methods in Physics Research A, pp 297-299 Apr.2001

FS Breaking strength (2)

- Very strong under elongation (and compression)
- Very fragile for shocks
- The Breaking strength is dramatically reduced by:
 - Cracks on the fiber surface
 - contact with metals or other hard surfaces
 - Humidity
 - some worry for ageing caused by humidity
 - no statistical evidence for this effect in our labs, but some "alarms"
 - this effect is reported by optical fiber producers (closest to the theoretical FS breaking strength)
 - good news from Glasgow for fibers under vacuum
 - more tests needed

H.Vocca - GWADV Isola d'Elba, Italy, May 19-26 2002

Coating of the wire surface

•Surface coating could prevent FS ageing •Effect of a Carbon coating (with Nitrogen contaminations) on loss angle has been tested •An evident increase of the wire loss angle has been measured •More tests are needed with different coatings and better thickness control. •It could be useful to damp the violin modes

of the wires.

H.Vocca - GWADV Isola d'Elba, Italy, May 19-26 2002

Potassium silicate bonding

- Silicate bonding is a Hydroxide-Catalysis chemical process.
- Test are made in a class 10000 clean room, under a class 100 laminar flux.

It is important a: -control of the purity of H₂O and KOH -accurate cleaning of the SiO₂ samples

In this conditions the breaking strength vs time of samples with different flatness quality has been investigated ($\lambda/4$, $\lambda/7$ and $\lambda/10$).

For $\lambda/10$ samples we are dominated by the clamping

•Mean λ/4 =2.5±0.6 MPa •Mean λ/7 =3.3±0.8 MPa

•Mean $\lambda/10 = 3.9 \pm 0.5$ MPa

H.Vocca - GWADV Isola d'Elba, Italy, May 19-26 2002

Silicate bonding as current technology

- Silicate bonding technology is used in the current Virgo assembling:
 - Spacers will be attached to the lateral surface of the mirror (polished @ $\lambda/10$ in a 40mm height strip) to improve the pendulum Q
 - Camera targets will be attached to the mirror
 - Magnets will be bonded through an intermediate fused silica disk to the face of the mirror directly on the reflective coating.

•Because of the complexity of the Virgo SA the hanging procedure will be very crucial (and difficult)

Monolithic solution

- With FS fibers we can gain in
 - $\hspace{0.2cm} \varphi_0$
 - thermoelastic damping because of

$$\boldsymbol{a}_{SiO_2} \approx 0.5 \cdot 10^{-6} K^{-1} < \boldsymbol{a}_{C_{85}} \approx 17 \cdot 10^{-6} K^{-1} \Longrightarrow \Delta_{SiO_2} < \Delta_{C_{85}}$$

- clamping losses
- breaking strength
- On the other hand we lose in C_s due to the dispersion of the breaking strength

H.Vocca - GWADV Isola d'Elba, Italy, May 19-26 2002

All Fused Silica Suspension

November **1998**, Perugia, quartz suspension system, in collaboration with GEO Glasgow

Very high Q measurements on a fused silica monolithic pendulum for use in enhanced gravitational wave detector.

G. Cagnoli, L. Gammaitoni, J. Hough, J. Kovalik, S. McIntosh, M. Punturo, S. Rowan. Phys. Rev. Lett. 85, 2442-2445, 2000

Mass 2.8 kg

•

- Length 30 cm
- Frequency 0.93 Hz
- 2 fused silica wires 400 µm diameter

What can we do best?

Thermoelastic loss angle (T=300°K)

H.Vocca - GWADV Isola d'Elba, Italy, May 19-26 2002

H.Vocca - GWADV Isola d'Elba, Italy, May 19-26 2002

(In collaboration with M. Tonelli, Dipartimento di Fisica of Pisa)

- Mono-crystal fibers are more robust with respect to ageing and OH contamination then amorphous ones
- With the addition of impurities of Yb³⁺, it is possible to cool the fiber optically with an anti-Stokes mechanism
- In the case of fibers, the optical path of the pumping radiation can be increased by using Total Internal Reflection to raise the intensity and absorption of the radiation.

• With this technique, it is possible to decrease the temperature by a few tens of Degrees Kelvin

Conclusions

- Thermal noise is and probably will be the main limit to the GW interferometers
 - Radiation pressure will limit the sensitivity if the laser power will increase dramatically
- Fused Silica suspension is the right solution if the ITF operates at room temperature
- Si fibers are, from the thermoelastic point of view, a possible alternative at RT.
- Cryogenic ITFs are the most promising evolution for the GW detectors
 - Mono-crystal fibers/rods (Si, or...) must be used to suspend and to extract the heat from the mirror
 - Localized cooling could be a useful technology to further reduce the temperature in the bending points of the suspension fibers
- We have enough work for the next years!!!
